KNOW-HOW FOR POTATO FARMING

# A FULL LINE KNOW-HOW FOR POTATO FARMING

AVR manufactures a full range of machinery for the cultivation of potatoes. From seed bed preparation, planting and ridging to haulm topping, harvesting and storing.

AVR's mission is clear: we make, sell and service machines for potato growers who want to work more efficiently and sustainably. We bring innovative technology and products to the market that enable more marketable potatoes to be tendered with less effort, less fuel, less time and less soil pollution.

## POTATO PLANTERS

The AVR potato planters, the Ceres series, are known for their robustness and precision. The range consists of two- up to four-row mounted or trailed planters. These cup planters are available with mechanic or hydraulic drive. Various combinations with soil cultivators, fertilisation and crop protection are possible.

## SOIL PREPARATION

A perfect preparation of the seedbed is extremely important for ideal harvesting conditions and a rich harvest. The AVR MultiForce®, AVR GE-Force, AVR Compact and AVR Combi machine (ecoridger/speedridger/weeder) create ideal growing conditions for the potatoes. Big, nice ridges with good crumbled soil make sure the potatoes have place enough to grow. Thanks to our cultivators and ridgers, you can be sure of an excellent start to the planting season.

## HAULM TOPPERS

Haulm topping several weeks before harvesting is an important step towards a successful harvest. It influences the yield, the quality and the storability of your harvest. The AVR Rafale cuts the haulm as short as possible to ensure ideal harvesting conditions.

## TRAILED POTATO HARVESTERS

You can get AVR's trailed harvesters in different types and sizes. From one- to two-row harvesting, with or without a bunker, several types of cleaning unit possibilities... AVR offers a suited machine for every condition or logistical situation, there is a machine available. Typical for AVR is the excellent harvesting quality, the potato friendliness, ease of maintenance and reliability in all circumstances. Thanks to its robustness and many clever solutions, an AVR harvester is your most reliable partner during harvest!

## CROP HANDLING

To store your valuable harvest quickly and efficiently, you can contact AVR for a complete storage line: receiving hoppers, (twin) conveyors, telescopic store loaders and stone and clod separators.

## SELF-PROPELLED POTATO HARVESTER

The AVR Puma is the flagship among harvesters. This four-row self-propelled harvester is worldwide market leader. Its huge capacity, balanced left-right weight distribution and its flexible cleaning module (the patented Varioweb) characterise this top-notch self-prop harvester. Thanks to its light weight and small turning circle, it is also very manoeuvrable. In addition, your machine can visualise its data digitally on a personal web platform, i.e. AVR Connect. Easy to remotely monitor settings or perform or schedule maintenance, among other things.
