

Sorting unit

The sorting unit is designed to separate a part of the product from the entire batch. This sorter is designed for potatoes, possibilities for other crops or products in consultation.

For sorting by size this machine will be combined with a 3D-Camera. The 3D sensor measures the length, width and height of each passing potato (or other product) by means of a laser beam.

Another possibility is to combine the sorter with a defects analyser. In this way the sorter can separate specific defects from the entire batch.

Technical specifications

- Stainless steel frame and housing
- Fingers:
 - are made of food safe plastics
 - are pneumatically controlled
 - are controlled separately
- Available in different sizes

- Perfect to combine with:
 - 3D-Camera
 - Defects analyser
 - Weighing systems
